

Egor Egorov

1C development and integrations.

I build missing workflows and fix failing ones in 1C:Enterprise. For more than six years, my work has covered distribution, accounting, logistics, document management, and product registration—from development and testing to branch rollout and production support.

● 6+ YEARS OF COMMERCIAL SOFTWARE DEVELOPMENT • INTEGRATIONS AND PRODUCTION SUPPORT

Commercial 1C development

Client and employer details are omitted because these systems are private. Technical descriptions are anonymised.

PRODUCT CATALOGUE

National product catalogue integration

2025–2026 • Senior 1C Developer • Catalogue integration

BUSINESS PROBLEM

Product registration and fiscal-document workflows needed current catalogue identifiers and names in 1C. Staff also needed to resolve portal errors and duplicate codes.

MY WORK

I developed the catalogue register and tools to retrieve NTINs by barcode (GTIN), replace duplicate or deactivated codes, reload corrections from Excel, and refresh Russian and Kazakh product names in batches. I added record history with user and timestamp tracking, including deletions.

TECHNICAL COMPLEXITY

I added bounded retries for rate limits and server errors, plus mock success and error responses for testing without the live portal. Updates follow replacement-code chains and preserve existing names when the portal returns empty values.

RESULT

The register was transferred to production 1C databases. Staff could retrieve missing identifiers in bulk and reload corrected rows. I also prepared instructions for uploads, portal submission, statuses, and errors.

Distribution routing and delivery exchange

2023–2026 • Senior 1C Developer • Logistics integration

BUSINESS PROBLEM

The route-planning service needed current orders and reference data from 1C. Planners also needed completed routes back in 1C.

MY WORK

I developed and extended exchanges for products, vehicles, delivery points, warehouses, shipment lines, and route results, with an operator screen, transfer logs, and selective resending.

TECHNICAL COMPLEXITY

Documents could change after export. I added reconciliation against saved outgoing XML: quantities, prices, weights, and volumes, with field-level mismatch logs and decimal-precision handling across branch databases.

RESULT

The exchange was tested with production-derived data, deployed at one branch, and supported in production while the team prepared further rollouts.

DOCUMENT WORKFLOW

Document management and 1C integration

2022–2023 • Senior 1C Developer • Document management integration

BUSINESS PROBLEM

The document-management system received email and XML data, created sales and return documents in 1C, and exchanged master data. Its SOAP interface also had to move to REST.

MY WORK

I rewrote the DMS API from SOAP to REST, made request headers and parameters case-insensitive, mapped incoming values to 1C reference data, added new XML fields and return rules, and rebuilt the master-data export as a one-action managed form.

TECHNICAL COMPLEXITY

Incoming files could contain missing or mismatched reference values. Database refreshes required the integration to reload messages and restore its initial state. I also added document validation, cache cleanup, consolidated logs, and a log viewer.

RESULT

The integration passed final testing in one branch with document checks and updated loading flows. Operators could trace which 1C documents came from each message and review exchange logs.

Trade, accounting, and field operations

2022–2024 • Senior 1C Developer • Platform development and support

BUSINESS PROBLEM

Branch teams used 1C Trade and 1C Accounting for delivery control, accounting documents, reports, and mobile sales workflows. Existing external reports and processors also had to be maintained inside the configurations.

MY WORK

I built a heater fuel write-off document, updated tyre-mileage and branch-cost reports, and moved external tools into 1C Accounting. In GIS, I added supervisor access and scheduled delivery reports using the Data Composition System (CKD), exported to Excel and emailed by organisation.

TECHNICAL COMPLEXITY

I extended delivery exports to include orders from linked warehouses. Other fixes covered routes completed after midnight, duplicate vehicle/device mappings, historical records, and distance-cache synchronisation.

RESULT

Branch staff gained a fuel write-off document, updated accounting and delivery reports, and supervisor access. Delivery workflows could include linked warehouses and correctly handle late route results.

1C capabilities

1C: ENTERPRISE DEVELOPMENT

I develop managed forms, documents, registers, reports, roles, data exchanges, and operator tools in 1C:Enterprise.

1C INTEGRATIONS

I connect 1C to REST and SOAP APIs, XML files, spreadsheets, mobile clients, document-management systems, route-planning services, and national catalogue systems.

1C SUPPORT AND DATA REPAIR

I trace exchanges across branch databases, repair duplicate and deleted records, update existing subsystems, and build validation, resend, and logging tools.

Supporting independent projects

Personal projects complement my commercial work with Python automation, backend development, and native clients.

Commands

Python library for automation: SSH, processes, networking, files, and OS calls.

Python • 2018–present

Pomodorough

Offline timer with device sync. I built the server, clients, and shared rules engine. Web/PWA is live; native clients remain development builds.

Go • Rust/WASM • SQLite • Swift • Kotlin

Other Swift projects: [Struggl](#), [Series](#), [Pinger](#), [MenuBarPing](#).
