

Egor Egorov

1C development and integrations.

I build missing workflows and fix failing ones in 1C:Enterprise. For more than six years, my work has covered distribution, accounting, logistics, document management, and product registration—from development and testing to branch rollout and production support.

● 6+ YEARS OF COMMERCIAL SOFTWARE DEVELOPMENT • INTEGRATIONS AND PRODUCTION SUPPORT

Commercial 1C development

Client and employer details are omitted because these systems are private. Technical descriptions are anonymised.

PRODUCT CATALOGUE

National product catalogue integration

2025–2026 • Senior 1C Developer • Catalogue integration

BUSINESS PROBLEM

Product registration and fiscal-document workflows needed current catalogue identifiers and names in 1C. Staff also needed to resolve portal errors and duplicate codes.

MY WORK

I extended the catalogue register and processing tools with NTIN lookup by barcode (GTIN), replacement of duplicate or deactivated codes, Excel correction imports, and batch updates of Russian and Kazakh names. I added record history with user and timestamp tracking, including deletions.

TECHNICAL COMPLEXITY

I added bounded retries for rate limits and server errors, plus mock success and error responses for testing without the live portal. Updates follow replacement-code chains and preserve existing names when the portal returns empty values.

RESULT

In production 1C databases, staff can retrieve missing identifiers and reload corrected rows in bulk. Record history makes catalogue edits and deletions traceable to a user and time. I also prepared operating instructions.

Distribution routing and delivery exchange

2023–2026 • Senior 1C Developer • Logistics integration

BUSINESS PROBLEM

The route-planning service needed current orders and reference data from 1C. Planners also needed completed routes back in 1C.

MY WORK

I extended the existing logistics exchange for products, vehicles, delivery points, warehouses, shipment lines, and route results. I built the operator screen and transfer logs, and added selective resending.

TECHNICAL COMPLEXITY

Documents could change after export. I added reconciliation against saved outgoing XML: quantities, prices, weights, and volumes, with field-level mismatch logs and decimal-precision handling across branch databases.

RESULT

After testing with production-derived data, the exchange was deployed at one branch. Operators could identify shipment mismatches by field and resend selected records. I supported production operation while the team prepared further rollouts.

DOCUMENT WORKFLOW

Document management and 1C integration

2022–2023 • Senior 1C Developer • Document management integration

BUSINESS PROBLEM

The document-management system received email and XML data, created sales and return documents in 1C, and exchanged master data. Its SOAP interface also had to move to REST.

MY WORK

I rewrote the DMS API from SOAP to REST, made request headers and parameters case-insensitive, mapped incoming values to 1C reference data, added new XML fields and return rules, and rebuilt the master-data export as a one-action managed form.

TECHNICAL COMPLEXITY

Incoming files could contain missing or mismatched reference values. Database refreshes required the integration to reload messages and restore its initial state. I also added document validation, cache cleanup, consolidated logs, and a log viewer.

RESULT

Operators could trace each incoming message to its 1C documents and inspect exchange logs when a load failed. The integration passed final testing in one branch with document validation and updated loading flows.

Accounting and delivery automation

2022–2024 · Senior 1C Developer · Platform development and support

BUSINESS PROBLEM

Branch teams used 1C Trade and 1C Accounting for delivery control, accounting documents, reports, and mobile sales workflows. Existing external reports and processors also had to be maintained inside the configurations.

MY WORK

I built a heater fuel write-off document, updated tyre-mileage and branch-cost reports, and moved external tools into 1C Accounting. In GIS, I added supervisor access and scheduled delivery reports using the Data Composition System (CKD), exported to Excel and emailed by organisation.

TECHNICAL COMPLEXITY

I extended delivery exports to include orders from linked warehouses. Other fixes covered routes completed after midnight, duplicate vehicle/device mappings, historical records, and distance-cache synchronisation.

RESULT

Delivery reports are generated on schedule and emailed as Excel files to recipients for each organisation. Staff can record heater fuel write-offs in 1C; delivery workflows include linked warehouses and account for routes completed after midnight.

1C capabilities

1C: ENTERPRISE DEVELOPMENT

I develop managed forms, documents, registers, reports, roles, data exchanges, and operator tools in 1C:Enterprise.

1C INTEGRATIONS

I connect 1C to REST and SOAP APIs, XML files, spreadsheets, mobile clients, document-management systems, route-planning services, and national catalogue systems.

1C SUPPORT AND DATA REPAIR

I trace exchanges across branch databases, repair duplicate and deleted records, update existing subsystems, and build validation, resend, and logging tools.

Supporting independent projects

Personal projects complement my commercial work with Python automation, backend development, and native clients.

Commands

Python library for automation: SSH, processes, networking, files, and OS calls.

Python · 2018–present

Pomodorough

Offline timer with device sync. I built the server, clients, and shared rules engine. Web/PWA is live; native clients remain development builds.

Go · Rust/WASM · SQLite · Swift · Kotlin

Other Swift projects: [Struggl](#), [Series](#), [Pinger](#), [MenubarPing](#).
